1. Rationale: The procedure of calculating the measures as per the working drawings and cost of various construction items is called an Estimate. Before initiating the construction works, the contractor/ owner should have thorough knowledge of the amount of work which is to be done and its costing. For this purpose, it is very essential to have an estimated quantity of work and the total amount it is going to cost. Estimation helps us in knowing the quantity of work, labour, materials and funds that will be required for the entire project thus enabling us to be prepared beforehand. Valuation is the technique of estimation or determining the fair price or value of property such as land, a building, a factory, other engineering structures of various types, etc. Valuation of building or property is the method of calculating the present marketable cost of a building. Valuation of a building depends on the sort of building, its structure, durability, location, size, shape, and the width of roads, frontage, types and quality of building materials used and the cost of these materials. It is expected the students should know the basics of the same to apply it in the field. Through this course students will develop the desired skills and competencies which are expected from them for Estimation and valuation related works.

2. Course Outcomes/Skill Sets: At the end of the semester student will be able to:

CO-01	Study the importance of estimation and detailed specifications for the various items required for construction of different types of structures.
CO-02	Analyse the rates and study factors affecting the rates for all works by applying standard rates for a given construction project.
CO-03	Prepare Bill of materials, Bill of Quantities and valuation report for a given construction project.
CO-04	Prepare contract documents for a given construction project with Negotiation and project financing skills

1. Rationale: Site management is a key element of the integrated project team. Site management is beneficial to society as the effective and efficient management of construction projects which will avoid escalation of costs, time overrun, wastage of resources, unlawful exploitation of labour and pollution of environment and safety precautions. Site management makes sure that the various tasks are conducted smoothly. Without site management, workers might not be authorized to work on their appointed tasks on time, equipment might not be distributed etc. It is expected that the students should know the basics of the same to apply it in the field. Through this course students will develop the desired skills and competencies which are expected from them for site management related works

2. Course Outcomes/Skill Sets: At the end of the semester, students will be able to

CO-01	Prepare a construction site plan on a project-specific basis to include phasing, temporary utilities and facilities, vertical and lateral transportation, storage facilities, security, safety, lighting, and environmental requirements.
CO-02	Manage staffing requirements including hiring, replacement and clearly articulate the roles of each individual recruited to operate while managing specific activities of construction at a given project site.
CO-03	Collect data and perform calculations periodically to enable an estimator to propose alternative construction methods, the right labour mix, equipment utilization and quality of construction for a given construction project.
CO-04	Implement an effective communication system, rigorous record keeping, safe keeping on site of product samples, project submittals, drawings etc and ensure compliance with safety norms as per OHSAS standards.
